Stands of quaking aspen (*Populus tremuloides* Michx.) are an uncommon and unique habitat type in the Blue Mountains (fig. 1). As one of very few broadleaf deciduous trees in a region dominated by conifers and semidesert grassland and scrub, aspen brings important diversity to the landscape. Aspen's palatable twigs and foliage, and tendency to develop cavities, make it valuable habitat for wildlife such as deer (*Odocoileus* sp.), elk (*Cervus elephas*), woodpeckers, and songbirds. Aspen often grow in riparian areas, providing shade, streambank stability, and nutrients from leaf-fall to streams.
